

**Welcoming security for historic houses and open displays**

A short range, narrow angle, mini PIR, sounds three chimes if someone enters its zone of protection. The unit is only 73mm high by 40mm wide and 30mm deep. It can be positioned, for example, on a table top, be attached to a table leg, placed inside a fireplace (as long as the fire is out) or in other secretive spots. Taking 3 x AAA batteries (provided), it can be left on 24 hours/day.

On triggering, it chimes three times to alert the room guide, it will then auto-reset after 2-3 seconds; Great for the protection of small areas or open displays within a room when open to the public.

ChimeAlert™ has a field of detection of approximately plus/minus 20° and 4m max range. This narrow angle and short distance gives more flexibility in use. It enables set ups which would be impossible for a wider angle, longer range PIR

Zone of protection: a cone with circle of 0.5m radius at 2m distance:

Person walking: across detection area activates unit approx 4m ....is not...  
 Person walking: towards detection area activates unit approx 2m  
 Hand/arm passing: across is detected at approx 2.5m .....is not detected

Typical battery life in 24hr / day use is 4 – 6 months, it is recommended to test each unit weekly and the batteries should be changed once the chime sound starts to weaken.

Note: if switched to the right (alarm mode) then after a one minute exit delay it is set. Then if triggered, the unit gives out 30 seconds of chimes and resets after 3 seconds. This mode is to assist the securing of rooms that are closed off or un-invigilated.
